Engineering

The process of devising a system, component, or process to meet desired needs. It is a decision-making process (often iterative) in which the basic sciences, mathematics, and engineering sciences are applied to convert resources optimally to meet a stated objective

Engineering

Systems Engineering is an interdisciplinary approach and means to enable the realization of successful systems. It focuses on defining customer needs and required functionality early in the development cycle, documenting requirements, then proceeding with design synthesis and system validation while considering the complete problem:

- Operations
- Performance
- Test
- Manufacturing
- Cost
- Schedule
- Training
- Support
- Disposal

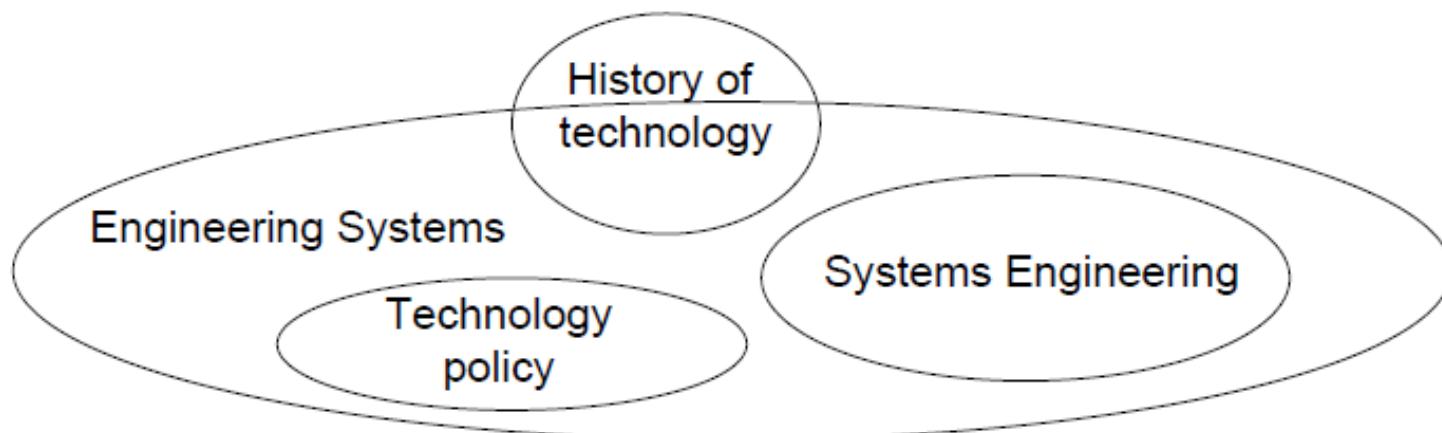

Systems Engineering

INCOSE
International Council on Systems
Engineering

- Systems Engineering integrates all the disciplines and specialty groups into a team effort forming a structured development process that proceeds from concept to production to operation.
- Systems Engineering considers both the business and the technical needs of all customers with the goal of providing a quality product that meets the user needs.

Engineering Systems & Systems Engineering

ESD mission: To establish Engineering Systems as a field of study focusing on complex engineered systems and products viewed in a broad human, social and industrial context. Use the new knowledge gained to improve engineering education and practice.

Engineering systems in Biology

Engineering Bio-systems

History of Systems Engineering

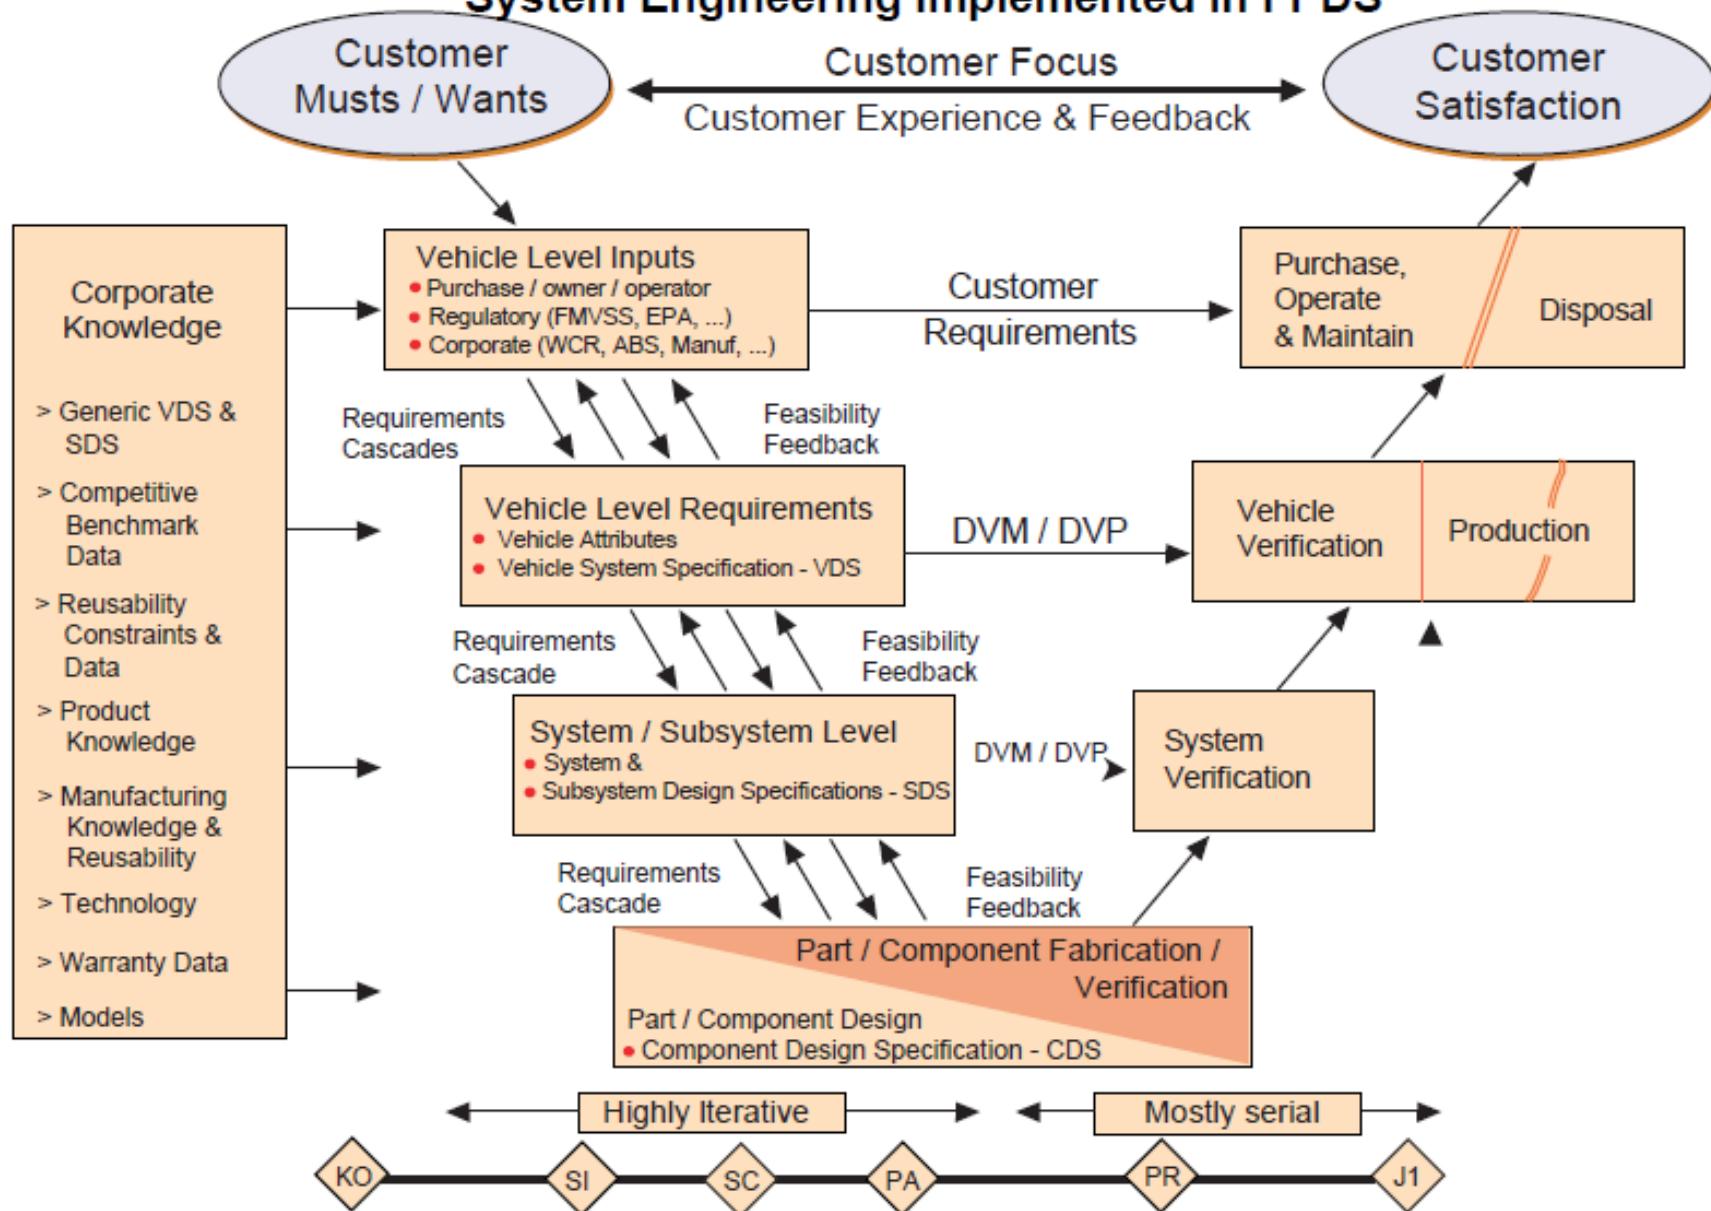

- Engineering has a long history
- Systems Engineering seems to be a more recent phenomenon
- Strongly related to management
- Post WWII government-funded projects played a major role in defining SE

System Engineering implemented: ARPANET

- A prime example of scalable architecture
- New trends in management of big projects
 - Flatter – Less centralized - Meritocratic
- Do these trends work for other systems?

每天隨時有 18668 kg 的蝦子在養數量

每週可收穫 2000 kg 的蝦子

每天餵飼 280 kg 的飼料

每天產出 224 kg 的藻類

每天產出 112 kg 的牡蠣肉，相當於 700 kg 的牡蠣

何謂 穩態量產？

- 立體化短期葉菜類栽培
- 35天生長期
- 育苗 14 天，育成 21 天
 - 3套系統 → 每週收穫
 - 21套系統 → 每天收穫

A. 體循環

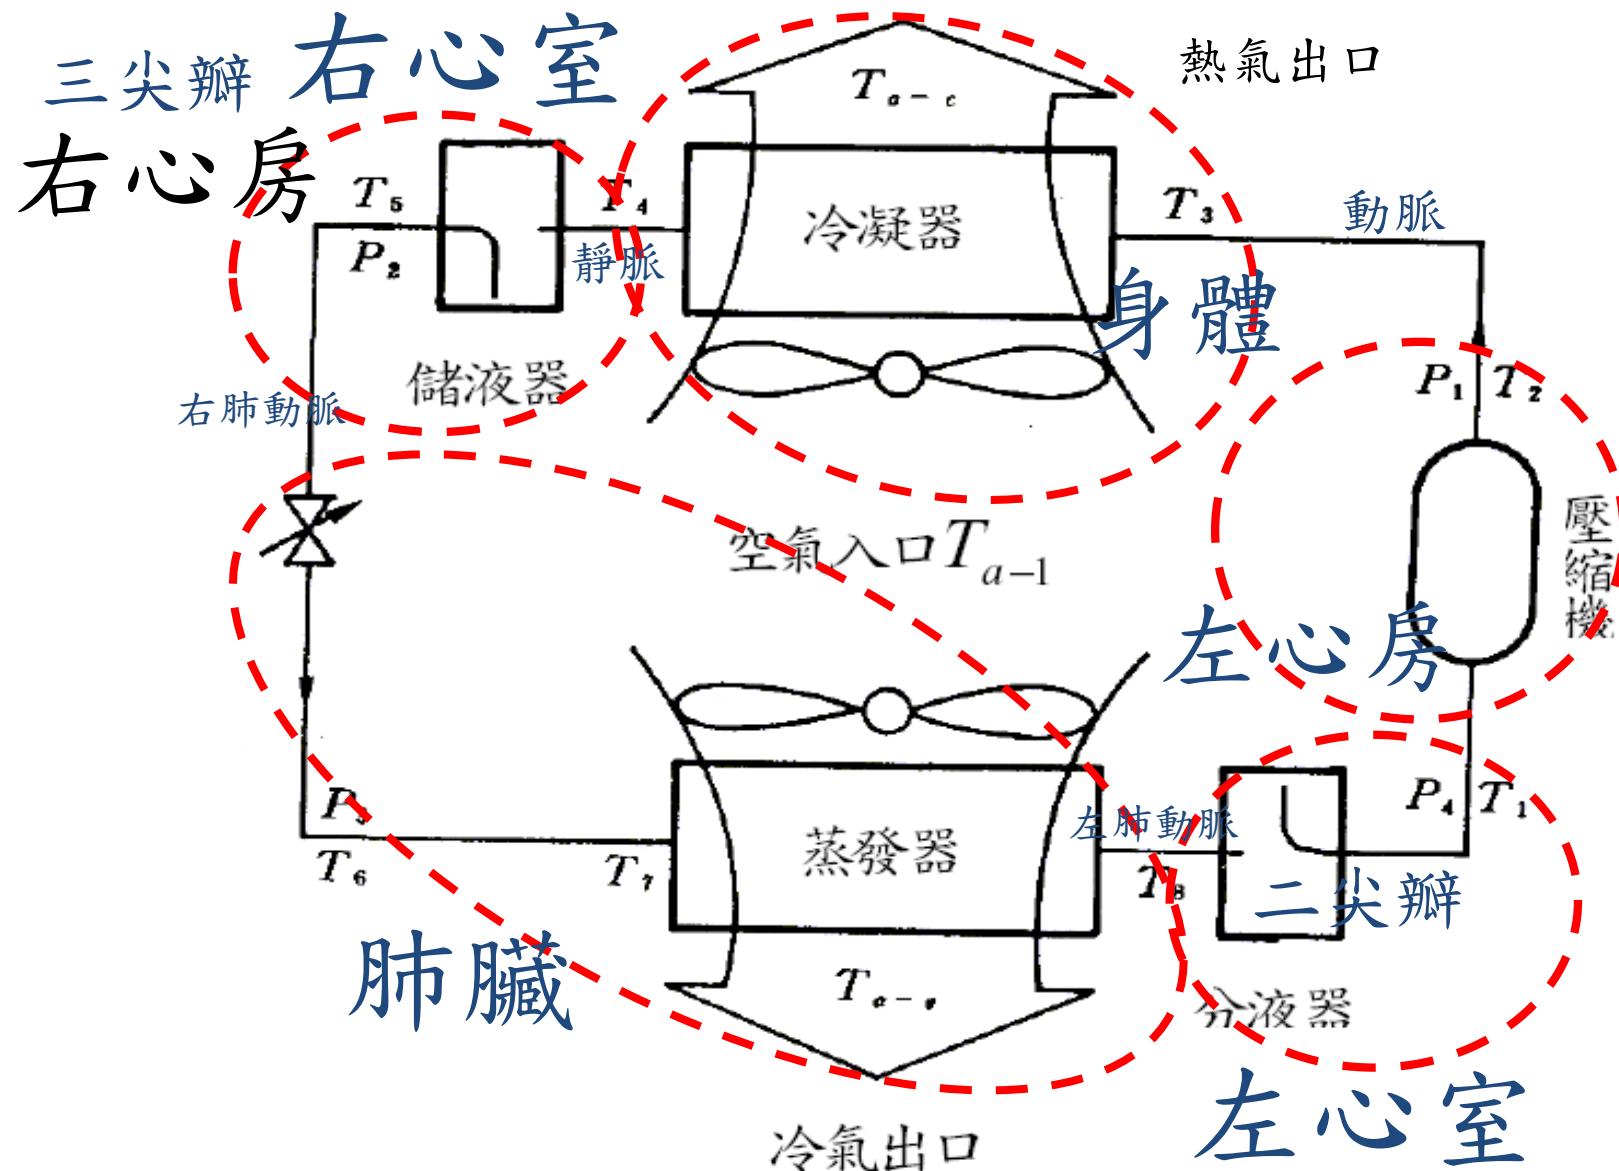

B. 肺循環

傳統 冷凍空調系統

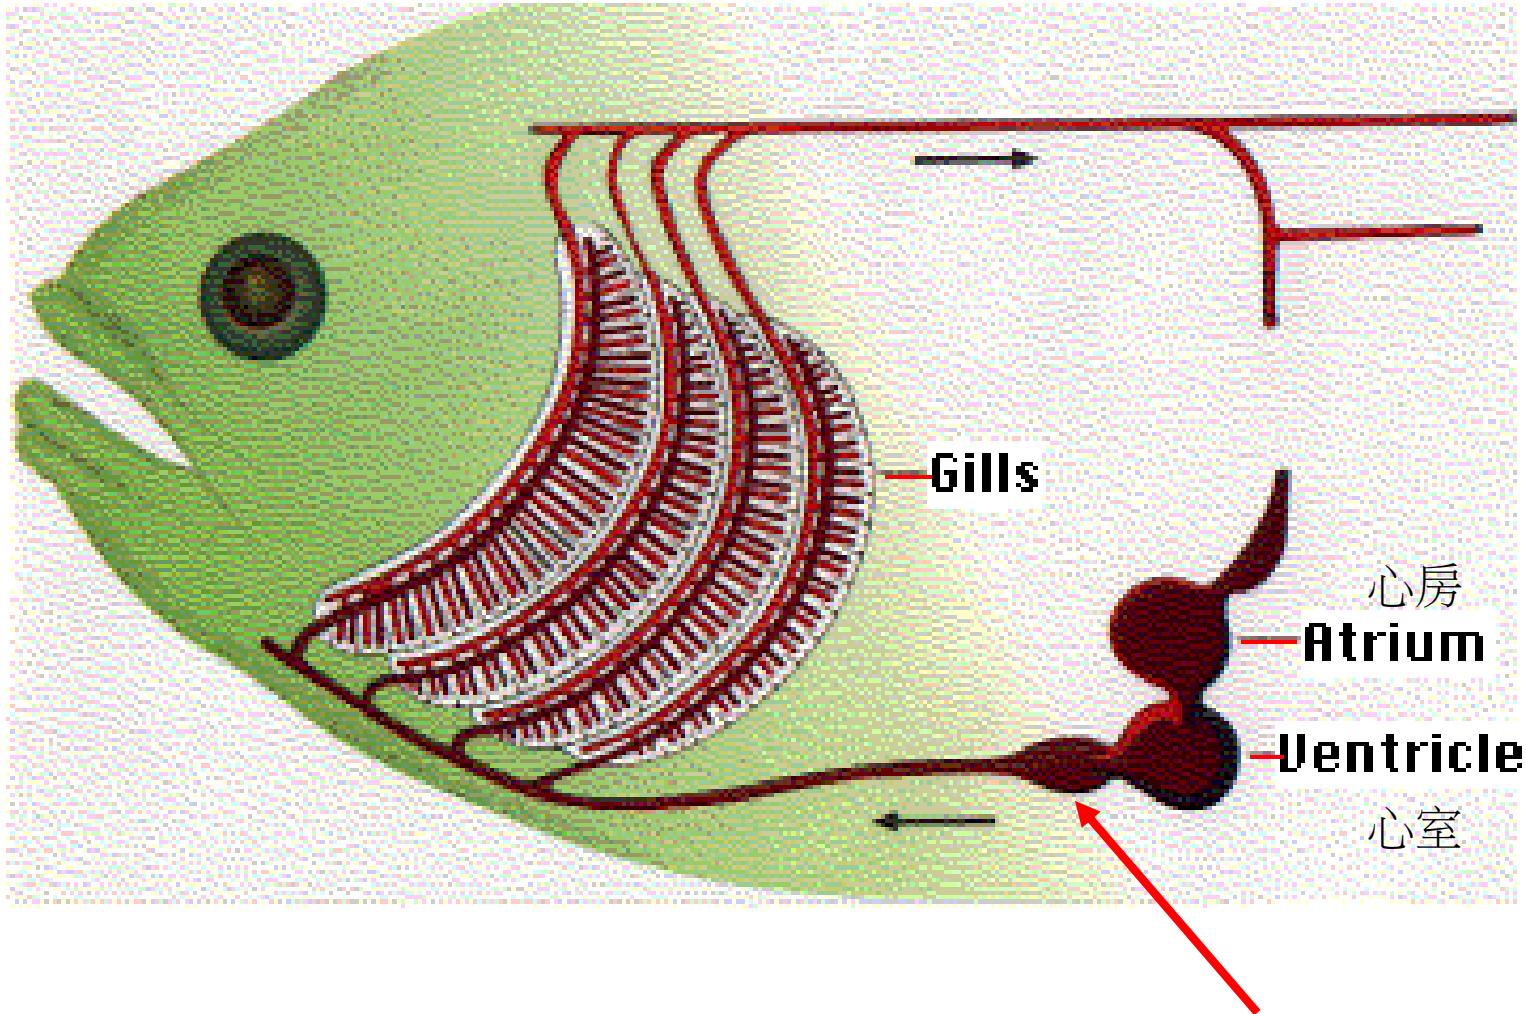

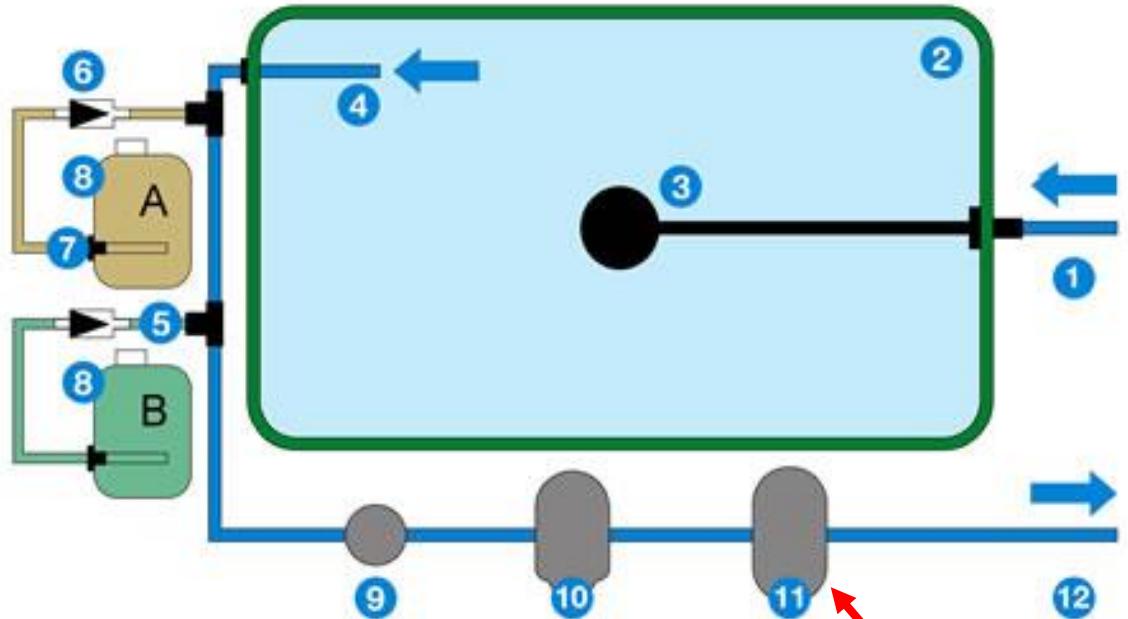

血液循環	冷凍空調
血管缺乏 舒張壓 就沒有彈性位能，血管與器官都會扁掉	冷媒管缺乏 低壓側壓力 ，大氣壓力與壓縮機的負壓會把冷媒管壓扁
收縮壓（血液擠向動脈）動態調配血液的力量	高壓側壓力
舒張壓（血液由動脈流出）保持血管彈性的力量	低壓側壓力 讓冷媒流回壓縮機的力量
體循環供給身體氧氣	高壓側散熱
肺循環交換取得氧氣	低壓側吸熱

Automation-Culture-Environment-Systems (ACESys) Oriented Approach to Phytomation

Concept of Automation-Culture-Environment Oriented Systems Analysis (ACESYS)

Components and Processes of Controlled Environment Bio-Production Systems may be categorized into three classes: (K.C. Ting, 1994)

- Automation – machine capabilities of information processing and physical work (including perception, reasoning/learning, communication, and task planning/execution)
- Culture – factors and practices that can directly describe and/or modify the growth and development of biological objects (e.g. morphological and physiological conditions, as well as cultural tasks including multiplication, nutrient delivery, disease prevention, harvesting, etc.)
- Environment – surroundings of biological objects (including climatic, nutritional, structural, and mechanical conditions)

Automation

Information Processing & Task Execution, e.g.

- Perception
- Reasoning / Learning
- Communication
- Task Planning & Execution

Culture

Factors and Practices which can Describe and/or Modify Growth and Development of Biological Objects, e.g.

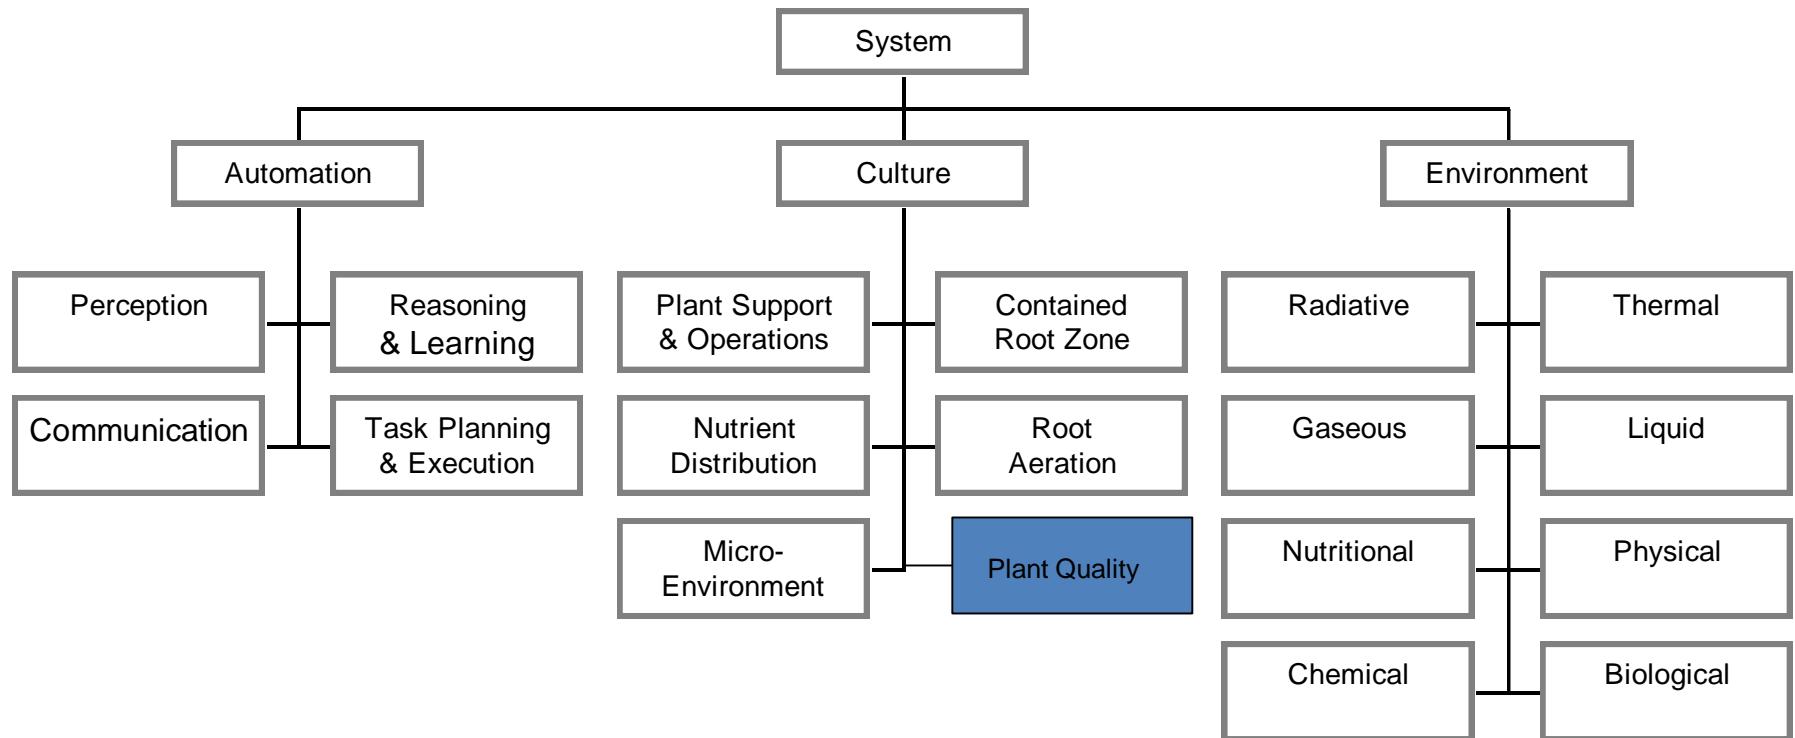

- Plant Support & Operations
- Nutrient Distribution
- Micro-Environment
- Contained Root Zone
- Root Aeration

Environment

The Surrounding of Biological Objects, e.g.

- Radiative, Thermal
- Gaseous, Liquid
- Physical, Chemical, Biological
